THE NATURAL DEVELOPMENT OF QUALITY

Having achieved the goal of fifty-five years working in the Refrigeration and Air Conditioning Industry, Castel's range of quality products is well known and highly appreciated around the world. Quality is the product of our Company philosophy and marks every step of the production cycle. It is certified by the company's Quality Management System (certified by TUV SUD in accordance with the UNI EN ISO 9001:2008 standard), as well as by the various product certifications of compliance with European Directives and European and extra-European Quality Marks.

Product quality is connected with the quality of manufacturing. We produce on high-tech machinery and updated automatic production lines, operating in compliance with the current safety and environmental protection standards.

Castel offers the Refrigeration and Air Conditioning Market and Manufacturers tested certified products suitable for use with the HCF and HFO refrigerants currently used in the Refrigeration & Air Conditioning Industry.

Based on the experience gained in the refrigeration field using fluorinated fluids, Castel is proud to present the Refrigeration and Air Conditioning Market and Manufacturers two complete lines of products developed and proven for use in systems using natural refrigerants: hydrocarbons (HC fluids) and carbon dioxide (R744).

DIRECTIVE 2014/68/EU ISSUED OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL OF 15 MAY 2014 ON PRESSURE EQUIPMENT

Directive 2014/68/EU (PED Recast) applies to the design, manufacture and evaluation of compliance of pressure equipment and assemblies with a maximum allowable pressure, PS, greater than 0.5 bar excluding the cases listed in Article 1, Paragraph 2 of the Directive.

Directive 2014/68/EU was transposed into the Italian legal system by Legislative Decree No. 26 dated 15 February 2016, published in the Official Journal of the Republic of Italy No. 53 of 4 March 2016.

The revised PED Recast Directive repeals previous Directive 97/23/EC. More specifically:

- Article 13 of the PED Recast Directive, regarding the classification of pressure equipment, came into force as of 1 June 2015 and repeals Article 9 of the previous PED Directive.

- All other articles of the PED Recast Directive are in force as of 19 July 2016, repealing all articles of the previous PED directive.

All safety valves, bursting disc devices and fusible plugs illustrated in this technical handbook are considered "Safety Accessories" according to the definition provided in Article 2, Point 4 of said Directive and are subject to the classification indicated in Article 4, Point 1.d) of the same Directive. All valves illustrated in this technical handbook are considered "Pressure Accessories" according to the definition provided in Article 2, Point 5 of said Directive and are subject to the classification indicated in Article 4, Points 1.c) and 3 of the same Directive.

EXTERNAL LEAKAGE

All the products illustrated in this Handbook are submitted, one by one, to tightness tests as well as specific functional tests. The allowable external leakage, measurable during the test, complies with the requirements of standards:

- EN 12284 : 2003 – Refrigerating systems and heat pumps - Valves - Requirements, testing and marking
- EN 16084 : 2011 – Refrigerating systems and heat pumps - Qualification of tightness of components and joints

PRESSURE CONTAINMENT

All the products illustrated in this Handbook, if submitted to hydrostatic testing, guarantee a pressure strength at least equal to $1.43 \times PS$ in compliance with Directive 2014/68/EU.

All the products illustrated in this Handbook, if submitted to burst test, guarantee a pressure strength at least equal to $3 \times PS$ according to EN 378-2 : 2016 Standard.

WEIGHT

The weights of the items listed in this Handbook include packaging and are not binding.

WARRANTY

All Castel products are covered by a 12-month warranty. This warranty covers all products or parts thereof that turn out to be defective within the warranty period. In this case, at his own expenses, the customer shall return the defective item with a detailed description of the claimed defects. The warranty does not apply if the defect of the Castel product is due to mistakes by the customer or by third parties, such as incorrect installation, use contrary to Castel instructions, or tampering. In the event of defects found in its products, Castel will only replace the defective goods and will not refund damages of any kind. Castel reserves the right to make changes or modifications to its products at any time without prior notice.

The products listed in this handbook are protected according to law.

CHAPTER 1

SAFETY VALVES IN SERIES 3030

GENERAL DESCRIPTION

The valves in series 3030 are unbalanced, conventional direct-loaded safety valves. The valve is opened by the thrust from the fluid under pressure below the shutter, when said thrust exceeds, under the calibrated conditions, the opposing force of the spring acting on the shutter.

Valves are identified by means of:

- a model number formed of an alphanumeric code that includes:
 - the family identity (for ex. 3030/44)
 - the type of connection (C = NPT ; G = Gas)
 - the set pressure, expressed in bar, multiplied by 10 (for ex. 250)
- An alphanumeric serial number

CONSTRUCTION

Body: squared, obtained through hot moulding and subsequent machining. It houses the following elements:

- the nozzle with flat sealing seat
 - the shutter guide
 - the set spring slot
 - the threaded seat of the setting adjustment ring nut
- In the body, above the shutter guide, a small pressure relief hole is provided through which the spring slot communicates with the atmosphere. For this reason, during relief, there is a gas leak through this orifice.

Material used: EN 12420-CW617N brass

Shutter: obtained through machining from bar stock and fit with gasket, it ensures the required degree of

tightness on the valve seat. The gasket is made from PTFE (Polytetrafluorethylene), a material that, during the valve's estimated service life, maintains good strength and does not cause the shutter to stick on the seat. The shutter is properly guided in the head and the guide action cannot fail. There are no glands or retaining rings that hamper its movement.

Material used: EN 12164-CW614N brass

Spring: it opposes the pressure and the fluid dynamic forces, and always ensures closing of the valve following pressure relief. When the shutter has reached the maximum height determined by the mechanical stop, the spring compression does not exceed 85% of the total compression.

Material used: DIN 17223-1 steel for springs.

Calibration system: hex-head threaded ring nut to be screwed inside the upper portion of the head, compressing the spring below. When calibration is complete, the position of the ring nut is maintained unchanged by applying to the threaded coupling a high mechanical strength and low viscosity bonding agent. The low viscosity promotes penetration. The calibration system is protected against subsequent tampering by means of a threaded cap nut, screwed on outside the head and sealed with a Castel lead seal.

SCOPE

Use: protection against possible overpressure of the apparatuses listed below, with regard to the operating conditions for which they have been designed:

- Refrigeration system or heat pump components, for instance: condensers, liquid receivers, evaporators, liquid accumulators, positive displacement compressor discharge, heat exchangers, oil separators, or piping. (reference standard: EN 378-2:2016)
- Simple pressure vessels (reference Directive: 2009/105/EC)

Fluids: the valves in series 3030 can be used with:

- a. Refrigerant fluids in vapour or gaseous state belonging to Group 2:
 - HCFC (R22)
 - HFC (R134a , R404A , R407C , R410A , R507)
 - HFO and HFO/HFC mixtures (R1234ze , R448A , R449A , R450A , and R452A)
 - R744

with reference to Article 13, Para. 1(b) of Directive 2014/68/EU (EC Regulation No. 1272/2008).

- b. Air and nitrogen (reference Directive: 2009/105/EC)

For specific applications with refrigerant fluids not listed above, please contact Castel Technical Department.

MARKING

In compliance with the provisions of Article 19 of Directive 2014/68/EC, the following information is reported on the valve body:

- Manufacturer's mark
- Country of manufacturing
- Indication of flow direction
- Maximum allowable pressure
- CE marking
- Identification number of the notified body involved in the production control phase

Again, on the body, the following information is laser marked:

- Valve model
- Serial number
- Set pressure
- Temperature range allowed
- Kd discharge coefficient
- Flow section
- Production date

DOCUMENTATION

The safety valves in series 3030 are supplied with the following documentation provided in the packaging:

- operating instructions for the user, containing all information useful for safety in terms of assembly, commissioning, use, and maintenance.
- Compliance Statement for the equipment according to Directive 2014/68/EU, required in Article 17 and issued in compliance with Annex IV of the same directive.
- Calibration certificate for the safety valve, printed on the reverse side of the Compliance Statement.

N.B.: on the website: www.castel.it use the "Certifications" pull-down menu to access the web-page "**Castel Certification Download Center**". On this page, you can download:

- the Compliance Statement / Calibration Certificate for each valve by entering the 7-digit alphanumeric serial number.
- the general Compliance Statement referring to a specific model of valve 3030 with a specific setting, for ex. 3030/44C250 or 3030/88C420.

VALVE SELECTION

Directive 2014/68/EC requires that pressure equipment, in which permissible limits are reasonably likely to be exceeded, shall be fitted with suitable protection devices, for instance safety devices such as safety valves. Such

devices shall prevent pressure from permanently exceeding the maximum allowable pressure (PS) of the equipment they protect. In any case, a short pressure peak limited to 10% of maximum allowable pressure is permitted.

As to the selection and sizing of the suitable protection device, users shall refer to the specific product and sector standards listed below:

- EN ISO 4126-1: 2013: "Safety devices for protection against excessive pressure – Part 1: Safety valves" indicates the general requirements for safety valves regardless of the fluid for which they were designed.
- EN 378-2:2016: "Refrigerating systems and heat pumps – safety and environmental requirements – Part 2: Design, construction, testing, marking and documentation" provides a general outline of the protection devices to be used in refrigerating systems and their characteristics (Para. 6.2.5) and the criteria for the selection of the device suitable for the type and size of the system component to be protected (Para. 6.2.6).
- EN 13136:2013: "Refrigerating systems and heat pumps – Pressure relief devices and their associated piping – Methods for calculation" highlights the possible causes of overpressure in a system and provides users with the tools for sizing pressure relief devices, among which safety valves.

To select the safety valves in series 3030, please see Chapter 5 "Selection Criteria for Safety Valves" in this technical handbook.

Tables 3 and 4 provide the maximum discharge capacities of safety valves, models 3030/44 and 3030/88, as a function of various refrigerants and varying P_{set} for the valve, considering $T_o =$ Steam saturation temperature at discharge pressure, P_o .

VALVE INSTALLATION

Safety valves type 3030 guarantee repeatable performance. This means that, after the valves have operated, open/close, the initial setting conditions are maintained. Nevertheless, it is advisable to replace a 3030 valve once it has discharged as during release debris, such as metal shavings or solder impurities, can deposit on the valve gasket. This can inhibit the safety valve from returning to its original conditions.

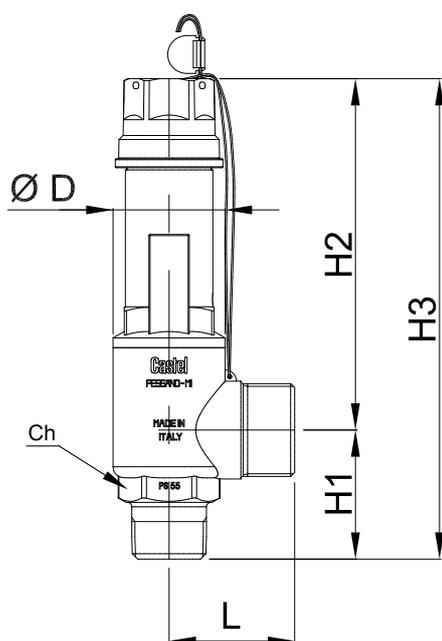

To calculate the pressure loss in either the upstream line (between vessel and safety valve) or the downstream line (between safety valve and atmosphere) refer to Chapter 5 "Selection Criteria for Safety Valves" in this technical handbook.

TABLE 1: General Characteristics of valves 3030

Catalogue Number	3030/44C	3030/44G	3030/66C	3030/88C

CHAPTER 2

SAFETY VALVES IN SERIES 3060

GENERAL DESCRIPTION

The valves in series 3060 are unbalanced, conventional direct-loaded safety valves. The valve is opened by the thrust from the fluid under pressure below the shutter, when said thrust exceeds, under the calibrated conditions, the opposing force of the spring acting on the shutter.

Valves are identified by means of:

- a model number formed of an alphanumeric code that includes:
 - the family identity (for ex. 3060/45)
 - the type of connection (C = NPT)
 - the set pressure, expressed in bar, multiplied by 10 (for ex. 300)
- an alphanumeric serial number.

CONSTRUCTION

Body: squared, obtained through hot moulding and subsequent machining. It houses the following elements:

- the nozzle with flat sealing seat
- the shutter guide
- the set spring slot
- the threaded seat of the setting adjustment ring nut

In the body, above the shutter guide, a small pressure relief hole is provided through which the spring slot communicates with the exit connection.

Material used: EN 12420-CW617N brass

Shutter: obtained through machining from bar stock and fit with gasket, it ensures the required degree of

tightness on the valve seat. The gasket is made from PTFE (Polytetrafluorethylene), a material that, during the valve's estimated service life, maintains good strength and does not cause the shutter to stick on the seat. The shutter is properly guided in the body and the guide action cannot fail. There are no glands or retaining rings that hamper its movement.

Material used: EN 12164-CW614N brass

Spring: it opposes the pressure and the fluid dynamic forces, and always ensures closing of the valve following pressure relief.

Material used: DIN 17223-1 steel for springs.

Calibration system: hex-head threaded ring nut to be screwed inside the upper portion of the body, compressing the spring below. When calibration is complete, the position of the ring nut is maintained unchanged by applying to the threaded coupling a high mechanical strength and low viscosity bonding agent. The low viscosity promotes penetration. The calibration system is protected against subsequent tampering by means of a threaded cap nut, screwed on outside the brass body and blocked in place through re-flanging.

SCOPE

Use: protection against possible overpressure of the apparatuses listed below, with regard to the operating conditions for which they have been designed:

- Refrigeration system or heat pump components, for instance: condensers, liquid receivers, evaporators, liquid accumulators, positive displacement compressor discharge, heat exchangers, oil separators, or piping. (reference standard: EN 378-2:2016)
- Simple pressure vessels (reference Directive: 2009/105/EC)

Fluids: the valves in series 3060 can be used with:

- a. Refrigerant fluids in vapour or gaseous state belonging to Group 2:
 - HCFC (R22)
 - HFC (R134a , R404A , R407C , R410A , R507)
 - HFO and HFO/HFC mixtures (R1234ze , R448A , R449A , R450A , and R452A)
 - R744

with reference to Article 13, Para. 1(b) of Directive 2014/68/EU (EC Regulation No. 1272/2008).

- b. Air and nitrogen (reference Directive: 2009/105/EC)

For specific applications with refrigerant fluids not listed above, please contact Castel Technical Department.

MARKING

In compliance with the provisions of Article 19 of Directive 2014/68/EC, the following information is reported on the valve body:

- Manufacturer's mark
- Country of manufacturing
- Indication of flow direction
- Maximum allowable pressure
- CE marking
- Identification number of the notified body involved in the production control phase

Again, on the body, the following information is laser marked:

- Valve model
- Serial number
- Set pressure
- Kd discharge coefficient
- Flow section
- Production date

DOCUMENTATION

The safety valves in series 3060 are supplied with the following documentation provided in the packaging:

- operating instructions for the user, containing all information useful for safety in terms of assembly, commissioning, use, and maintenance.
- Compliance Statement for the equipment according to Directive 2014/68/EU, required in Article 17 and issued in compliance with Annex IV of the same directive.
- Calibration certificate for the safety valve, printed on the reverse side of the Compliance Statement.

N.B.: on the website: www.castel.it use the "Certifications" pull-down menu to access the web-page "**Castel Certification Download Center**". On this page, you can download:

- the Compliance Statement / Calibration Certificate for each valve by entering the 7-digit alphanumeric serial number.
- the general Compliance Statement referring to a specific model of valve 3060 with a specific setting, for ex. 3060/24C250 or 3060/45C420.

VALVE SELECTION

Directive 2014/68/EC requires that pressure equipment, in which permissible limits are reasonably likely to be exceeded, shall be fitted with suitable protection devices, for instance safety devices such as safety valves. Such devices shall prevent pressure from permanently exceeding the maximum allowable pressure (PS) of the equipment

they protect. In any case, a short pressure peak limited to 10% of maximum allowable pressure is permitted.

As to the selection and sizing of the suitable protection device, users shall refer to the specific product and sector standards listed below:

- EN ISO 4126-1: 2013: "Safety devices for protection against excessive pressure – Part 1: Safety valves" indicates the general requirements for safety valves regardless of the fluid for which they were designed.
- EN 378-2:2016: "Refrigerating systems and heat pumps – safety and environmental requirements – Part 2: Design, construction, testing, marking and documentation" provides a general outline of the protection devices to be used in refrigerating systems and their characteristics (Para. 6.2.5) and the criteria for the selection of the device suitable for the type and size of the system component to be protected (Para. 6.2.6).
- EN 13136:2013: "Refrigerating systems and heat pumps – Pressure relief devices and their associated piping – Methods for calculation" highlights the possible causes of overpressure in a system and provides users with the tools for sizing pressure relief devices, among which safety valves.

To select the safety valves in series 3060, please see Chapter 5 "Selection Criteria for Safety Valves" in this technical handbook.

Tables 7, 8, 9, 10 and 11 provide the maximum discharge capacities of safety valves, models 3060/23-/24, 3060/33-/34, 3060/45, 3060/36 and 3060/46, as a function of various refrigerants and varying P_{set} for the valve, considering T_o = Steam saturation temperature at discharge pressure, P_o .

VALVE INSTALLATION

Safety valves type 3060 do NOT guarantee repeatable performance. This means that, after the valves have operated, open/close, the initial setting conditions are NOT maintained.

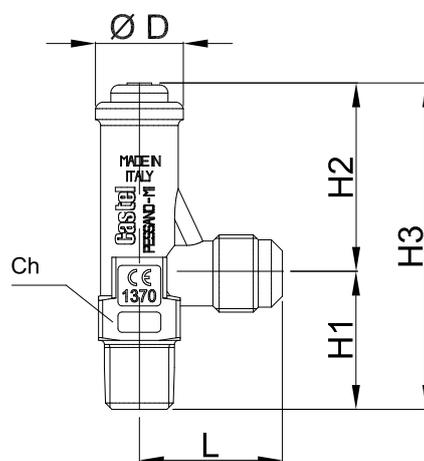

To calculate the pressure loss in either the upstream line (between vessel and safety valve) or the downstream line (between safety valve and atmosphere) refer to Chapter 5 "Selection Criteria for Safety Valves" in this technical handbook.

CHAPTER 3

SAFETY VALVES IN SERIES 3061

GENERAL DESCRIPTION

The valves in series 3061 are unbalanced, conventional direct-loaded safety valves. The valve is opened by the thrust from the fluid under pressure below the shutter, when said thrust exceeds, under the calibrated conditions, the opposing force of the spring acting on the shutter.

Valves are identified by means of:

- a model number formed of an alphanumeric code that includes:
 - the family identity (for ex. 3061/3)
 - the type of inlet connection (for ex. C = NPT)
 - the set pressure, expressed in bar, multiplied by 10 (for ex. 200)
- an alphanumeric serial number.

CONSTRUCTION

Body: squared, obtained through hot moulding and subsequent machining. It houses the following elements:

- the nozzle with flat sealing seat
- the shutter guide
- the set spring slot
- the threaded seat of the setting adjustment ring nut

In the body, above the shutter guide, a small pressure relief hole is provided through which the spring slot communicates with the exit connection. For this reason, during relief, there is a no gas leak through this orifice.

Material used: EN 12420-CW617N brass

Shutter: obtained through machining from bar stock and fit with gasket, it ensures the required degree of tightness on the valve seat. The gasket is made from modified PTFE (Polytetrafluorethylene), a material that, during the valve's estimated service life, maintains good strength and does not cause the shutter to stick on the seat. The shutter is properly guided in the body and the guide action cannot fail. There are no glands or retaining rings that hamper its movement.

Material used: EN 12164-CW614N brass

Spring: it opposes the pressure and the fluid dynamic forces, and always ensures closing of the valve following pressure relief. When the shutter has reached the maximum height determined by the mechanical stop, the spring compression does not exceed 80% of the total compression. All the springs are compliant with the compression helical spring requirements defined in EN ISO 4126-7:2013.

Material used: EN 10270-2 - FD steel for springs.

Calibration system: hex-head threaded ring nut to be screwed inside the upper portion of the head, compressing the spring below. When calibration is complete, the position of the ring nut is maintained unchanged by applying to the threaded coupling a high mechanical strength and low viscosity bonding agent. The low viscosity promotes penetration. The calibration system is protected against subsequent tampering by means of a threaded cap nut, screwed on outside the brass body and blocked in place through re-flanging.

SCOPE

Use: protection against possible overpressure of the apparatuses listed below, with regard to the operating conditions for which they have been designed:

- Refrigeration system or heat pump components, for instance: condensers, liquid receivers, evaporators, liquid accumulators, positive displacement compressor discharge, heat exchangers, oil separators, or piping. (reference standard: EN 378-2:2016)
- Simple pressure vessels (reference Directive: 2009/105/EC)

Fluids: the valves in series 3061 can be used with:

- Refrigerant fluids in vapour or gaseous state belonging to Group 2:
 - HCFC (R22)
 - HFC (R134a , R404A , R407C , R410A , R507)
 - HFO and HFO/HFC mixtures (R1234ze , R448A , R449A , R450A , and R452A)
 - R744

with reference to Article 13, Para. 1(b) of Directive 2014/68/EU (EC Regulation No. 1272/2008).

- b. Refrigerant fluids in vapour or gaseous state belonging to Group 1:
- HFO (R1234yf)
 - HC (R290, R600, R600a)

with reference to Article 13, Para. 1(a) of Directive 2014/68/EU (EC Regulation No. 1272/2008).

- c. Air and nitrogen (reference Directive: 2009/105/EC)

For specific applications with refrigerant fluids not listed above, please contact Castel Technical Department.

MARKING

In compliance with the provisions of Article 19 of Directive 2014/68/EC, the following information is cast on the valve body:

- Manufacturer's mark
- Country of manufacturing
- Indication of flow direction
- Maximum allowable pressure

Again, on the body, the following information is laser marked:

- Valve model
- Serial number
- Set pressure
- Allowable temperature range
- Kd discharge coefficient
- Flow section
- Production date
- CE marking
- Identification number of the notified body involved in the production control phase

DOCUMENTATION

The safety valves in series 3061 are supplied with the following documentation provided in the packaging:

- operating instructions for the user, containing all information useful for safety in terms of assembly, commissioning, use, and maintenance.
- Compliance Statement for the equipment according to Directive 2014/68/EU, required in Article 17 and issued in compliance with Annex IV of the same directive.
- Calibration certificate for the safety valve, printed on the reverse side of the Compliance Statement.

N.B.: on the website: www.castel.it use the "Certifications" pull-down menu to access the web-page "**Castel Certification Download Center**". On this page, you can download:

- the Compliance Statement / Calibration Certificate for each valve by entering the 7-digit alphanumeric serial number.
- the general Compliance Statement referring to a specific model of valve 3061 with a specific setting, for ex. 3061/2C250 or 3061/4C420.

VALVE SELECTION

Directive 2014/68/EC requires that pressure equipment, in which permissible limits are reasonably likely to be exceeded, shall be fitted with suitable protection devices, for instance safety devices such as safety valves. Such devices shall prevent pressure from permanently exceeding the maximum allowable pressure (PS) of the equipment they protect. In any case, a short pressure peak limited to 10% of maximum allowable pressure is permitted.

As to the selection and sizing of the suitable protection device, users shall refer to the specific product and sector standards listed below:

- EN ISO 4126-1: 2013: "Safety devices for protection against excessive pressure – Part 1: Safety valves" indicates the general requirements for safety valves regardless of the fluid for which they were designed.
- EN 378-2:2016 "Refrigerating systems and heat pumps – Safety and environmental requirements – Part 2: Design, construction, testing, marking and documentation" provides a general outline of the protection devices to be used in refrigerating systems and their characteristics (Para. 6.2.5) and the criteria for the selection of the device suitable for the type and size of the system component to be protected (Para. 6.2.6).
- EN 13136:2013: "Refrigerating systems and heat pumps – Pressure relief devices and their associated piping – Methods for calculation" highlights the possible causes of overpressure in a system and provides users with the tools for sizing pressure relief devices, among which safety valves.

To select the safety valves in series 3061, please see Chapter 5 "Selection Criteria for Safety Valves" in this technical handbook.

Table 14 provides the maximum discharge capacities of safety valves, models 3061/2, 3061/3 and 3061/4, as a function of various refrigerants and varying P_{set} for the valve, considering T_0 = Steam saturation temperature at discharge pressure, P_0 .

VALVE INSTALLATION

Safety valves type 3061 guarantee repeatable performance. This means that, after the valves have operated, open/close, the initial setting conditions are maintained. Nevertheless, it is advisable to replace a 3061 valve once it has discharged as during release debris, such as metal shavings or solder impurities, can deposit on the valve gasket. This can inhibit the safety valve from returning to its original conditions.

To calculate the pressure loss in either the upstream line (between vessel and safety valve) or the downstream line (between safety valve and atmosphere) refer to Chapter 5 "Selection Criteria for Safety Valves" in this technical handbook.

TABLE 12 : General Characteristics of valves 3061

Catalogue Number		3061/2C	3061/3C	3061/4C

CHAPTER 4 ■

SAFETY VALVES IN SERIES 3065

GENERAL DESCRIPTION

The valves in series 3065 are unbalanced, conventional direct-loaded safety valves. The valve is opened by the thrust from the fluid under pressure below the shutter, when said thrust exceeds, under the calibrated conditions, the opposing force of the spring acting on the shutter.

Valves are identified by means of:

- a model number formed of an alphanumeric code that includes:
 - the family identity (for ex. 3065/4)
 - the type of inlet connection (for ex. C = NPT)
 - the set pressure, expressed in bar, multiplied by 10 (for ex. 140)
- an alphanumeric serial number

CONSTRUCTION

Body: squared, obtained through hot moulding and subsequent machining. It houses the following elements:

- the nozzle with flat sealing seat
- the shutter guide
- the set spring slot
- the threaded seat of the setting adjustment ring nut

In the body, above the shutter guide, a small pressure relief hole is provided through which the spring slot communicates with the exit connection. For this reason, during relief, there is a no gas leak through this orifice.

Material used: EN 12420-CW617N brass

Shutter: obtained through machining from bar stock and fit with gasket, it ensures the required degree of tightness on the valve seat. The gasket is made from modified PTFE (Polytetrafluorethylene), a material that, during the valve's estimated service life, maintains good strength and does not cause the shutter to stick on the seat. The shutter is properly guided in the body and the guide action cannot fail. There are no glands or retaining rings that hamper its movement.

Material used: EN 12164-CW614N brass

Spring: it opposes the pressure and the fluid dynamic forces, and always ensures closing of the valve following pressure relief. When the shutter has reached the maximum height determined by the mechanical stop, the spring compression does not exceed 80% of the total compression. All the springs are compliant with the compression helical spring requirements defined in EN ISO 4126-7:2013.

Material used: EN 10270-2 - FD steel for springs.

Calibration system: hex-head threaded ring nut to be screwed inside the upper portion of the head, compressing the spring below. When calibration is complete, the position of the ring nut is maintained unchanged by applying to the threaded coupling a high mechanical strength and low viscosity bonding agent. The low viscosity promotes penetration. The calibration system is protected against subsequent tampering by means of a threaded cap nut, screwed on outside the brass body and blocked in place through re-flanging.

SCOPE

Use: protection against possible overpressure of the apparatus listed below, with regard to the operating conditions for which they have been designed:

- Refrigeration system or heat pump components, for instance: condensers, liquid receivers, evaporators, liquid accumulators, positive displacement compressor discharge, heat exchangers, oil separators, or piping (reference standard: EN 378-2:2016)
- Simple pressure vessels (reference Directive: 2009/105/EC)

Fluids: the valves in series 3065 can be used with:

- a. Refrigerant fluids in vapour or gaseous state belonging to Group 2:
 - HCFC (R22)
 - HFC (R134a , R404A , R407C , R410A , R507)
 - HFO and HFO/HFC mixtures (R1234ze , R448A , R449A , R450A , and R452A)
 - R744

with reference to Article 13, Para. 1(b) of Directive 2014/68/EU (EC Regulation No. 1272/2008).

- b. Refrigerant fluids in vapour or gaseous state belonging to Group 1:
- HFC (R32)
 - HFO (R1234yf)
 - HC (R290 , R600 , R600a)

with reference to Article 13, Para. 1(a) of Directive 2014/68/EU (EC Regulation No. 1272/2008).

- c. Air and nitrogen (reference Directive: 2009/105/EC)

For specific applications with refrigerant fluids not listed above, please contact Castel Technical Department.

MARKING

In compliance with the provisions of Article 19 of Directive 2014/68/EC, the following information is cast on the valve body:

- Manufacturer's mark
- Country of manufacturing
- Indication of flow direction
- Maximum allowable pressure

Again, on the body, the following information is laser marked:

- Valve model
- Serial number
- Set pressure
- Allowable temperature range
- Kd discharge coefficient
- Flow section
- Production date
- CE marking
- Identification number of the notified body involved in the production control phase

DOCUMENTATION

The safety valves in series 3065 are supplied with the following documentation provided in the packaging:

- operating instructions for the user, containing all information useful for safety in terms of assembly, commissioning, use, and maintenance.
- Compliance Statement for the equipment according to Directive 2014/68/EU, required in Article 17 and issued in compliance with Annex IV of the same directive.
- Calibration certificate for the safety valve, printed on the reverse side of the Compliance Statement.

N.B.: on the website: www.castel.it use the "Certifications" pull-down menu to access the web-page "**Castel**

Certification Download Center". On this page, you can download:

- the Compliance Statement / Calibration Certificate for each valve by entering the 7-digit alphanumeric serial number.
- the general Compliance Statement referring to a specific model of valve 3065 with a specific setting, for ex. 3065/4C250 or 3065/6C420.

VALVE SELECTION

Directive 2014/68/EC requires that pressure equipment, in which permissible limits are reasonably likely to be exceeded, shall be fitted with suitable protection devices, for instance safety devices such as safety valves. Such devices shall prevent pressure from permanently exceeding the maximum allowable pressure (PS) of the equipment they protect. In any case, a short pressure peak limited to 10% of maximum allowable pressure is permitted.

As to the selection and sizing of the suitable protection device, users shall refer to the specific product and sector standards listed below:

- EN ISO 4126-1: 2013: "Safety devices for protection against excessive pressure – Part 1: Safety valves" indicates the general requirements for safety valves regardless of the fluid for which they were designed.
- EN 378-2:2016 "Refrigerating systems and heat pumps – Safety and environmental requirements – Part 2: Design, construction, testing, marking and documentation" provides a general outline of the protection devices to be used in refrigerating systems and their characteristics (Para. 6.2.5) and the criteria for the selection of the device suitable for the type and size of the system component to be protected (Para. 6.2.6).
- EN 13136:2013: "Refrigerating systems and heat pumps – Pressure relief devices and their associated piping – Methods for calculation" highlights the possible causes of overpressure in a system and provides users with the tools for sizing pressure relief devices, among which safety valves.

For sizing of the safety valves in series 3065, please see Chapter 5 "Selection Criteria for Safety Valves" in this technical handbook.

Table 17 provides the maximum discharge capacities of safety valves, models 3065/4 and 3065/6, as a function of various refrigerants and varying P_{set} for the valve, considering $T_0 =$ Steam saturation temperature at discharge pressure, P_0 .

VALVE INSTALLATION

Safety valves type 3065 guarantee repeatable performance. This means that, after the valves have operated, open/close, the initial setting conditions are maintained. Nevertheless, it is advisable to replace a 3065 valve once it has discharged as during release debris, such as metal shavings or solder impurities, can

deposit on the valve gasket. This can inhibit the safety valve from returning to its original conditions.

To calculate the pressure loss in either the upstream line (between vessel and safety valve) or the downstream line (between safety valve and atmosphere) refer to Chapter 5 "Selection Criteria for Safety Valves" in this technical handbook.

CHAPTER 5

SELECTION CRITERIA FOR SAFETY VALVES

CALCULATION OF THE DISCHARGE CAPACITY (REF. EN 13136:2013)

The evaluation of the minimum required discharge capacity of safety valves is closely linked to the type of system where the equipment protected by the valve is installed, with the causes that may cause the safety valve to open, i.e.:

- **External heat sources** (Para. 6.2.1 - EN 13136:2013). The minimum required discharge capacity is determined by the following formula:

$$Q_{md} = \frac{3600 \times \varphi \times A_{surf}}{h_{vap}} \text{ [kg/h]}$$

where:

- φ = density of heat flow rate, assumed to be 10 [kW/m²]
 - A_{surf} = external surface area of the vessel [m²]
 - h_{vap} = latent heat of vaporization of liquid at p_o [kJ/kg]
- **Internal heat sources** (Para. 6.2.2 - EN 13136:2013). The minimum required discharge capacity is determined by the following formula:

$$Q_{md} = \frac{3600 \times Q_h}{h_{vap}} \text{ [kg/h]}$$

where Q_h = rate of heat production [KW]

- **Increased pressure caused by a positive displacement compressor** (Para. 6.3 - EN 13136:2013). The minimum required discharge capacity is determined by the following formula:

$$Q_{md} = 60 \times V \times n \times \rho_{10} \times \eta_v \text{ [kg/h]}$$

where:

- V = theoretical displacement of compressor [m³]
- n = rotational frequency of compressor [min⁻¹]
- ρ_{10} = vapour density of refrigerant, from the saturation curve at a temperature of 10 °C [kg/m³].
- Table 18 provides the values of ρ_{10} for:
 - traditional HCFC and HFC refrigerants most commonly used
 - new HFO and HFC/HFO blend refrigerants
 - natural HC fluids

(for R744, the ρ_{-40} vapour density value for CO₂ is indicated, from the saturation curve at a temperature of -40 °C [kg/m³]).

- η_v = volumetric efficiency of the compressor, estimated at suction pressure and discharge pressure equivalent to the safety valve setting.

SIZING OF SAFETY VALVES DESIGNED TO DISCHARGE GAS OR VAPOUR AT CRITICAL FLOW (Ref. EN ISO 4126-1: 2013 and EN 13136 :2013)

Critical flow occurs when the back-pressure p_b (the pressure existing immediately at the outlet of the valve) is lower than or equal to the critical pressure:

$$p_b \leq p_o \left[\frac{2}{k+1} \right]^{\frac{k}{k-1}} \text{ [bar abs]}$$

where:

- p_o = actual relieving pressure, upstream the valve. It's equal to the set pressure plus overpressure; that is, the pressure increase over the set pressure at which the shutter has its total lift [bar abs]
- k = isentropic exponent of gas or vapour, based on the actual temperature and pressure conditions upstream of the valve during the discharge phase under full flow.

If k is unknown or difficult to determine, it is possible to assume:

$$p_{critica} = 0,5 \times p_o \text{ [bar abs]}$$

A valve that discharges to the atmosphere, is under in critical flow conditions.

The safety valves designed to discharge gas or vapour at critical flow must be sized using the following calculation, shown in Paragraph 7.2.5.2 of the EN 13136:2013 standard.

$$A_c = 3,469 \times \frac{Q_{md}}{C \times 0,9 \times K_d} \times \sqrt{\frac{v_o}{p_o}} \text{ [mm}^2\text{]}$$

where:

- A_c = minimum net cross-section area of the valve orifice [mm²]
- Q_{md} = minimum required discharge capacity of safety valve [kg/h]
- K_d = certified discharge ratio of safety valve
- p_o = actual pressure upstream of the safety valve during discharge of the entire flow, see definition above. [bar abs]
- v_o = specific volume of gas or vapour at discharge conditions p_o and T_o , where T_o is the fluid temperature at valve inlet, defined by the user or by the designer [m³/kg]
- C = expansion rate as a function of the k coefficient in the isentropic equation calculated with the following formula:

$$C = 3,948 \times \sqrt{k \times \left| \frac{2}{k+1} \right|^{\frac{k+1}{k-1}}}$$

for this calculation, the value of k refers to a temperature of 25 °C. (Para. 7.2.3, EN 13136:2013 standard).

Table 18 provides the k and C values for:

- traditional HCFC and HFC refrigerants most commonly used
- new HFO and HFC/HFO blend refrigerants
- natural HC fluids and R744

To calculate the flow rate of a safety valve, under specific operating conditions, use the following formula, provided in Para. 7.2.5.2 of EN 13136:2013.

$$Q_m = 0,2883 \times C \times A \times 0,9 \times K_d \times \sqrt{\frac{p_o}{v_o}}$$

where:

- Q_m = maximum discharge capacity of safety valve [kg/h]
- A = net cross-section area of the valve orifice [mm²]

This formula was used to calculate the maximum discharge flow of the safety valve shown in:

- Table 3 and 4 for valves in series 3030
- Table 7, 8, 9, 10 and 11 for valves in series 3060
- Table 14 for valves in series 3061
- Table 17 for valves in series 3065

INSTALLATION OF A SAFETY VALVE

(Ref. EN 13136:2013)

As far as the installation of safety valves is concerned, remember these basic points:

- Safety valves must be installed near an area of the system where vapours or gases are present and where there is no fluid turbulence. They must be placed in as close to an upright position as possible, with the inlet connector turned downwards.
- Vessels joined by piping, of a diameter deemed by the manufacturer and the user to be adequate, without any stop valves between them, may be considered as a single vessel for the installation of a safety valve.
- The fitting between the valve and the equipment to be protected must be as short as possible. Furthermore, the cross-section of the piping must not be smaller than the valve inlet. In any case, EN 13136:2013 states that the pressure drop between the protected vessel and the safety valve, at discharge capacity, shall not exceed 3% of the setting value, p_o , including any accessory on the line.
- The location selected for installation of the safety valve must consider that valve operation involves the discharge of the refrigerant fluid under pressure, sometimes at high temperature. Where there is the risk

of causing injuries to people nearby, exhaust piping must be provided, sized so as to not compromise valve operation. EN 13136:2013 states that this piping must not generate, at discharge capacity, a back-pressure exceeding 10% of pressure p_o , for unbalanced, conventional valves. In the event of multiple valves installed in parallel, it is highly recommended that each valve be fit with a dedicated exhaust line rather than a single manifold for all of the valves. The risk of the latter solution is to create an overpressure in the manifold determined when a valve discharges. This overpressure can modify the operating characteristics of all the other valves installed in parallel.

Pressure losses in the upstream line

To calculate the pressure losses in the upstream line (between vessel and safety valve) refer to Section 7.4 of EN 13136:2013.

The upstream pressure loss is given by:

$$\frac{\Delta p_{in}}{p_o} = 0,032 \times \left[\frac{A_c}{A_{in}} \times C \times K_{dr} \right]^2 \times \xi$$

where:

- A_c = minimum calculated flow cross-section area [mm²]
- A_{in} = cross-section area of inlet tube to valve [mm²]
- $K_{dr} = K_d \times 0.9$, reduced discharge coefficient
- C = expansion rate as a function of the k coefficient in the isentropic equation for the refrigerant fluid
- ξ = sum of the of pressure loss coefficients ξ_n of the individual components and piping.

The coefficients ξ_n refer to:

- pipe element losses, such as fittings and elbows
 - valve losses
 - losses along the piping
- and are listed in standard EN 13136:2013, Table A.4.

Pressure losses in the downstream line

To calculate the pressure losses in the downstream line (between safety valve and atmosphere) refer to Section 7.4 of EN 13136:2013.

The downstream pressure loss is given by:

$$p_1 = \sqrt{0,064 \times \xi \times \left(\frac{A_c}{A_{out}} \times C \times K_{dr} \times p_o \right)^2} + p_2^2$$

where:

- P_1 = inlet pressure to discharge line [bar abs]
- P_2 = outlet pressure to discharge line, equal to atmospheric pressure [bar abs]
- A_c = minimum calculated flow cross-section area [mm²]
- A_{out} = cross-section area of valve outlet pipe [mm²]
- $K_{dr} = K_d \times 0.9$, reduced discharge coefficient

- C = expansion rate as a function of the k coefficient in the isentropic equation for the refrigerant fluid
- p_o = actual pressure downstream of the safety valve during discharge of the entire flow [bar abs]
- ξ = sum of the of pressure loss coefficients ξ_n of the piping
The coefficients ξ_n refer to:
 - pipe element losses, bends
 - losses along the piping
 e sono elencati nella Tabella A.4 della norma EN 13136:2013.

**EXAMPLE 1: Calculation of the flow rate (Q_{md}) and selection of the safety valve
(Increased pressure caused by a positive displacement compressor)**

Compressor data

- Bore: 82.5 mm
- Stroke: 69.8 mm
- Number of cylinders 4
- Rotational frequency 1450 rpm
- Clearance 4%
- Refrigerant fluid R407C

The theoretical displacement of the compressor is:

$$V = \frac{\pi}{4} \times 0,0825^2 \times 0,0698 \times 4 = 0,00149 \text{ [m}^3\text{]}$$

Maximum allowable pressure of the liquid condenser / receiver: PS = 25 bar
Set pressure of the safety valve installed on the upper crown of the condenser housing: $p_{set} = 25$ bar

Calculation of the valve discharge pressure under full flow exhaust conditions: using a safety valve in series 3065 with an overpressure of 10%:

$$p_o = p_{set} \times \left(1 + \frac{10}{100}\right) + 1 = 28,5 \text{ [bar abs]}$$

Operating conditions of compressor at the safety valve discharge:

Condensation temperature: +65.2 °C (28.5 bar abs)

Evaporation temperature: +10 °C (6.33 bar abs)

These conditions, defined by the designer, are assumed to be the most unfavourable for the safety valve due to operating faults such as:

- Movement errors
- Non-operation of automatic safety devices that should have been triggered prior to the safety valve due to failures or other reasons

Calculation of minimum full discharge capacity

For cautionary reasons, ignoring the vapour overheating at the outlet of the evaporator, the volumetric efficiency of compressor is:

$$\eta_v = 1 - 0,04 \times \frac{P_{mandata}}{P_{aspirazione}} = 1 - 0,04 \times \frac{28,5}{6,33} = 0,82$$

and so the minimum required full discharge capacity:

$$Q_{md} = 60 \times V \times n \times \rho_{10} \times \eta_v = 60 \times 0,00149 \times 1450 \times 27,45 \times 0,82 = 2918 \text{ [kg/h]}$$

where $\rho_{10} = 27.45$ [kg/m³], saturated vapour density of R407C at a temperature of 10 °C

Sizing of minimum flow cross-section area of the safety valve

$$A_c = 3,469 \times \frac{Q_{md}}{C \times 0,9 \times K_d} \times \sqrt{\frac{v_o}{p_o}} = 3,469 \times \frac{2918}{2,51 \times 0,9 \times 0,87} \times \sqrt{\frac{0,0069}{28,5}} = 80,3 \text{ [mm}^2\text{]}$$

where:

- $C = 2.51$, corresponding to k exponent for R407C, equal to 1.14, according to Table 1
- $K_d = 0.87$, certified discharge ratio of safety valve 3065/4
- $v_o = 0.0069$ [m³/kg], specific volume of the saturated vapour upstream of the safety valve during operation. This value refers to the following operating conditions upstream of the valve:
 - Pressure $p_o = 28.5$ [bar abs]
 - Temperature $T_o = 65.2$ [°C]

Conclusion: the selected safety valve is model 3065/4 with the following characteristics:

- certified discharge ratio, $K_d = 0.87$
- nozzle cross-section area, $A = 132.73$ [mm²]
- set pressure, $p_{set} = 25$ bar

Verification of the system upstream the safety valve

Assuming the valve installed is 3065/4C250, using a steel fitting with the following characteristics:

- $d_{in} = 17$ [mm], fitting inside diameter
- $A_{in} = 227$ [mm²], fitting inside cross-section area
- $L = 60$ [mm], fitting length
- Condenser connection: Flush with the housing and with a sharp edge

The following information is taken from Table A.4 in standard EN 13136:2013:

- $\xi_{1(\text{inlet})} = 0.25$
- $\xi_{2(\text{length})} = \lambda \times L / \text{din} = 0.02 \times 60 / 17 = 0.07$ with $\lambda = 0.02$ for steel pipe
- $\xi_T = \xi_1 + \xi_2 = 0.25 + 0.07 = 0.32$

Between the safety valve and the steel fitting, a shut-off valve type 3064/44 is installed.

The main characteristics of this valve are:

- $d_R = 13$ [mm], inside valve diameter
- $A_R = 132.7$ [mm²], inside valve cross-section area
- $kv = 10$ [m³/h], valve kv coefficient

The pressure loss coefficient ξ_R of the shut-off valve is given by:

$$\xi_R = 2,592 \times \left[\frac{132,7}{10}\right]^2 \times 10^{-3} = 0,45$$

Total loss coefficient: $\xi_T + \xi_R = 0.77$

Recalling the previously calculated cross-section, the characteristics of safety valve 3065/4 and refrigerant fluid R407C:

- $A_c = 80.3$ [mm²]
- $K_d = 0.87 \times 0.9 = 0.783$
- $C = 2.51$

The pressure loss is given by:

$$\frac{\Delta p_{in}}{p_o} = 0,032 \times \left[\frac{80,3}{227} \times 2,51 \times 0,783 \right]^2 \times 0,77 = 0,012$$

The pressure loss value obtained is admissible because it is lower than the value of 0.03 indicated in standard EN 13136:2013.

Verification of system downstream the safety valve

Suppose it is necessary to construct a discharge pipe on safety valve 3065/4C250, using 1" gas pipe with the following characteristics:

- $d_{out} = 30$ [mm], inside pipe diameter
- $A_{out} = 707$ [mm²], inside pipe cross-section area
- $L = 3000$ [mm], pipe length
- 90° elbow with bending radius, R, equal to three times external diameter of pipe

The following information is taken from Table A.4 in standard EN 13136:2013:

- $\xi_{1 (elbow)} = 0.25$
- $\xi_{2 (length)} = \lambda \times L / d_{out} = 0.02 \times 3000 / 30 = 2$ where $\lambda = 0.02$ for steel pipe
- $\xi_T = \xi_1 + \xi_2 = 0.25 + 2 = 2.25$

The pressure loss is given by:

$$p_1 = \sqrt{0,064 \times 2,25 \times \left(\frac{80,3}{707} \times 2,51 \times 0,783 \times 28,5 \right)^2 + 1^2} = 2,61$$

$$= \frac{\Delta p_{out}}{p_o} = \frac{2,61 - 1}{28,5} = 0,056 \text{ [bar]}$$

The pressure loss value obtained is admissible because it is lower than the value of 0.10 indicated in standard EN 13136:2013.

N.B.: All steps performed in the previous example, that is:

- calculation of minimum discharge capacity
- sizing of minimum cross-sectional area of the valve orifice
- calculation of the load loss in the upstream system
- calculation of the load loss in the downstream system can be performed using the selection software available on the Castel website.

EXAMPLE 2: Calculation of the flow rate (Q_{md}) and selection of the safety valve (Increase in pressure caused by internal heat source)

Data for the liquid receiver

- Refrigerant fluid R404A
- Pressure equipment 300 l liquid receiver

- External surface area of the vessel 3.2 m²
- PS of the vessel 28 bar

Calculation of the valve discharge pressure under full flow exhaust conditions: using a safety valve in series 3061 with an overpressure of 10%:

$$p_0 = (p_{set} \times 1,1) + 1 = (28 \times 1,1) + 1 = 31,8 \text{ [bar abs]}$$

Calculation of minimum discharge capacity

Calculation of the flow rate for the external heat source considering that there are flammable substances in such quantities as to feed a fire near the vessel to be protected.

$$Q_{md} = \frac{3600 \times \varphi \times A_{surf}}{h_{vap}} = \frac{3600 \times 10 \times 3,2}{67,28} = 1712 \text{ [kg/h]}$$

where:

- φ = density of heat flow rate, assumed to be 10 [kW/m²]
- A_{surf} = external surface area of the vessel [m²]
- h_{vap} = latent heat of vaporization of R404A at pressure p_o [kJ/kg]

Sizing of minimum flow cross-section area of the safety valve

The safety valves to discharge gas or vapour at critical flow must be sized using the following formula.

$$A_c = 3,469 \times \frac{Q_{md}}{C \times 0,9 \times K_d} \times \sqrt{\frac{v_o}{p_o}} =$$

$$3,469 \times \frac{1712}{2,5 \times 0,9 \times 0,89} \sqrt{\frac{0,004231}{31,8}} = 34,2 \text{ [mm}^2\text{]}$$

where:

- A_c = minimum net cross-section area of the valve orifice [mm²]
- Q_{md} = minimum required discharge capacity of safety valve [kg/h]
- C = expansion rate as a function of the k coefficient in the isentropic equation for the R404A refrigerant fluid
- K_d = certified discharge ratio of safety valve 3061/4
- p_o = pressure downstream of the valve during operation [bar abs]
- v_o = specific volume of the saturated vapour upstream of the safety valve during operation. This value refers to the following operating conditions upstream of the valve:
 - Pressure $p_o = 31.8$ [bar abs]
 - Temperature $T_o = 64.7$ [°C] (saturation temperature)

Conclusion: the selected safety valve is model 3061/4 with the following characteristics:

- certified discharge ratio, $K_d = 0.89$
- nozzle cross-section area, $A = 44.2$ [mm²]
- set pressure, $p_{set} = 28$ bar of standard EN 13136:2013.

Verification of the system upstream the safety valve

Assuming the valve installed is 3061/4C280, using a steel fitting with the following characteristics:

- $d_{in} = 17$ [mm] , fitting inside diameter
- $A_{in} = 227$ [mm²] , fitting inside cross-section area
- $L = 60$ [mm] , fitting length
- Receiver connection: Flush with the housing and with a sharp edge

The following data is taken from Table A.4:

- $\xi_{1 \text{ (inlet)}} = 0.25$
- $\xi_{2 \text{ (length)}} = \lambda \times L / d_{in} = 0.02 \times 60 / 17 = 0.07$
with $\lambda = 0.02$ for steel pipe
- $\xi_T = \xi_1 + \xi_2 = 0.25 + 0.07 = 0.32$

Between the valve and the fitting, an exchange valve (type 3032/44) has been installed.

The main characteristics of this valve are:

- $d_R = 13$ [mm] , inside valve diameter
- $A_R = 132.7$ [mm²] , inside valve cross-section area
- $kv = 3.3$ [m³/h] , valve kv coefficient

The pressure loss coefficient ξ_R of the exchange valve is given by:

$$\xi_R = 2,592 \times \left[\frac{132,7}{3,3} \right]^2 \times 10^{-3} = 4,19$$

Total loss coefficient: $\xi_T + \xi_R = 4.51$

Recalling the previously calculated cross-section, the characteristics of safety valve 3061/4 and refrigerant fluid R404A:

- $A_c = 34.2$ [mm²]
- $K_{dr} = 0.89 \times 0.9 = 0.801$
- $C = 2.50$

The pressure loss is given by:

$$\frac{\Delta p_{in}}{p_o} = 0,032 \times \left[\frac{34,2}{227} \times 2,50 \times 0,801 \right]^2 \times 4,51 = 0,013$$

The pressure loss value obtained is admissible because it is lower than the value of 0.03 indicated in standard EN 13136:2013.

CHAPTER 6

CHANGEOVER VALVES IN SERIES 3032, 3032N, AND 3032E

APPLICATIONS

Changeover valves in series 3032, 3032N and 3032E perform the role of a service valve for a pair of safety valves, allowing the use of one and the exclusion of the other. This device allows the user to work on the isolated valve, for periodic inspection or replacement, while the line is completely operative and the system safety is integral. N.B.: each safety valve located on the changeover valve must have sufficient capacity to protect the vessel alone.

Valves models 3032/33, 3032N/33 and 3032E/33 are supplied with:

- Two female 3/8" NPT threaded connections with swivel nut, Castel code 3039/3
- Two O-Rings for these connections

These components ensure perfect alignment of a pair of safety valves 3060/33, 3060/34, 3060/36 or 3061/3.

Valves models 3032/44, 3032N/44 and 3032E/44 are supplied with:

- Two female 1/2" NPT threaded connections with swivel nut, Castel code 3039/4
- Two O-Rings for these connections

These components ensure perfect alignment of a pair of safety valves 3060/45, 46/46 or 3061/4.

Valves, models: 3032/64, 3032N/64, and 3032E/64; 3032/66, 3032N/66, and 3032E/66; 3032/88, 3032N/88, and 3032E/88; and 3032/108, 3032N/108, and 3032E/108 do not have threaded connections with swivel nuts on the outlet connection. Therefore, valve models 3030/44, 3030/66, 3030/88, 3065/4 and 3065/6 are screwed directly on to the changeover valve.

The valves in this chapter can be used with the same fluids foreseen for safety valves series 3030, 3060, 3061 and 3065, specifically:

- Valves in series 3032 can be used with the following refrigerant fluids:
 - HCFC (R22)
 - HFC (R134a, R32, R404A, R407C, R410A or R507)

- HFO and HFO/HFC mixtures (R1234yf, R1234ze, R448A, R449A, R450A or R452A)

- Valves in series 3032N can be used with the following refrigerant fluids:

- HFC (R134a, R32, R404A, R407C, R410A or R507)
- HFO and HFO/HFC mixtures (R1234yf, R1234ze, R448A, R449A, R450A or R452A)
- HC (R290, R600, R600a)

CAUTION! Valves in series 3032N cannot be installed on systems that use HCFC (R22) refrigerants or other refrigerants blended with mineral oils or alkylbenzenes.

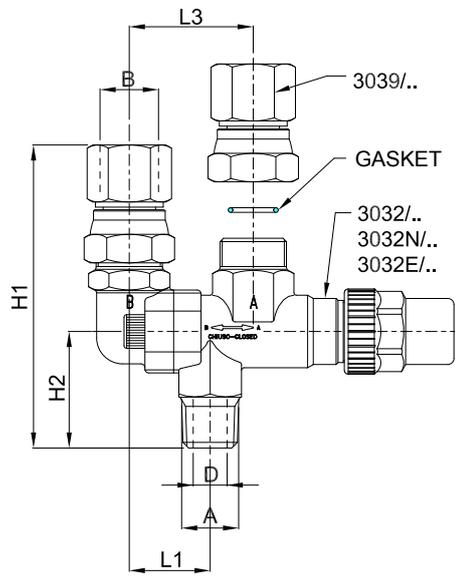

- Valves in series 3032E can be used only with refrigerant fluid R744.

CONSTRUCTION

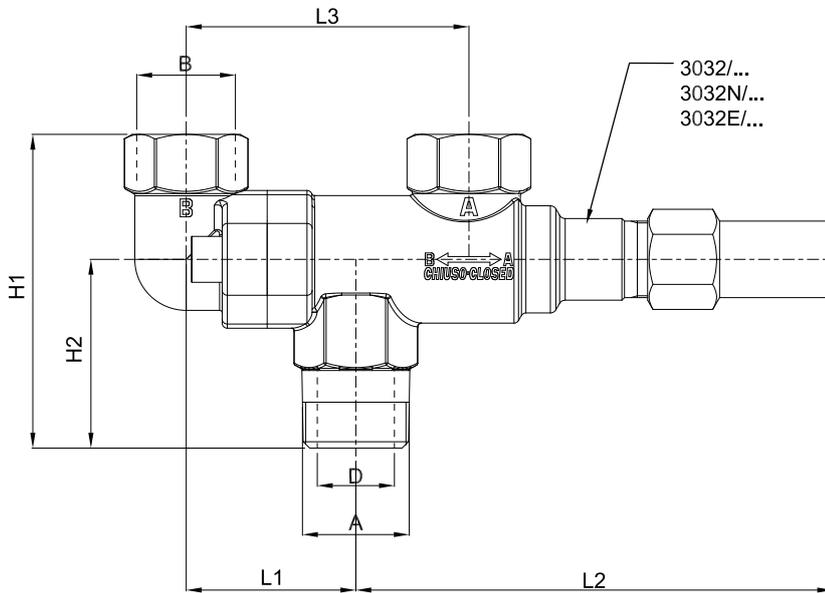

Valves in series 3032, 3032N and 3032E are designed so that it is never possible to exclude both safety valves simultaneously. Under working conditions, the shutter must be clamped against one of the two seats of the valve, front port or back port, in order to ensure always full discharge to the corresponding safety valve. Intermediate shutter positions must be avoided in order not to affect the operation of both safety valves. The valve ensures a pressure drop perfectly compatible with the safety valve operation under saturated vapour and superheated vapour discharge conditions.

The main parts of the valves in series 3032, 3032N, and 3032E are made from the following materials:

- Hot forged brass EN 12420 – CW 617N for the body
- Steel, with proper surface protection, for the spindle.
- Chloroprene rubber (CR) for outlet seal gaskets in valves series 3032
- Hydrogenated nitrile butadiene rubber (HNBR) for outlet seal gaskets in valves series 3032N
- Ethylene propylene diene monomer rubber (EPDM) for outlet seal gaskets in valves series 3032E
- Glass reinforced PBT for the protective cap that covers the spindle.
- Hot forged steel EN 12420 – CW 617N for the protective cap of the spindle for models from 1" to 1-1/4" NPT.

CHAPTER 7 ■ FITTINGS IN SERIES 3035

The fittings in series 3035 allow for the installation of:

- safety valves in series 3030, 3060, 3061 and 3065
- bursting disc devices in series 3070
- shut-off valves in series 3064, 3064N and 3064E
- changeover valves in series 3032, 3032N and 3032E

near pressure equipment to be protected in the system. These fittings are designed to be installed in two ways:

- Construct a copper pipe by-pass that connects the pressure equipment to the fitting. Insert the end of the by-pass in the solder connection of the fitting and then perform capillary brazing.
- Drill the inner/outer pipe near the pressure equipment (if possible, it is best to build a collar on the pipe). Put the end of the fitting into this hole and proceed to braze weld.

The fittings in series 3035 are produced by machining brass bars EN 12164-CW614N.

CHAPTER 8 ■ SHUT-OFF VALVES IN SERIES 3064, 3064N, AND 3064E

APPLICATIONS

Please remember that the operation of pressure equipment and pressure assemblies is not covered by Directive 2014/68/EC ; rather, it is regulated by the national legislation of the Member States of the European Union. Therefore, the various Member States have issued laws that call for periodic inspection of pressure equipment and pressure assemblies. Italy issued Ministerial Decree 329 dated 01/12/2004 regarding the provisions for the installation and use of pressure equipment and pressure assemblies that comply with Directive 97/23/EC.

Any intervention for periodic inspection or replacement of an installed safety device becomes very difficult if the protected vessel is not equipped with a shut-off valve.

Shut-off valves in series 3064, 3064N and 3064E installed between the protected vessel and the safety valve, allow the device to be disassembled for inspection or replacement without blowing off all the refrigerant fluid from an entire section of the system.

The valves in this chapter can be used with the same fluids foreseen for safety valves series 3030, 3060, 3061 and 3065, specifically:

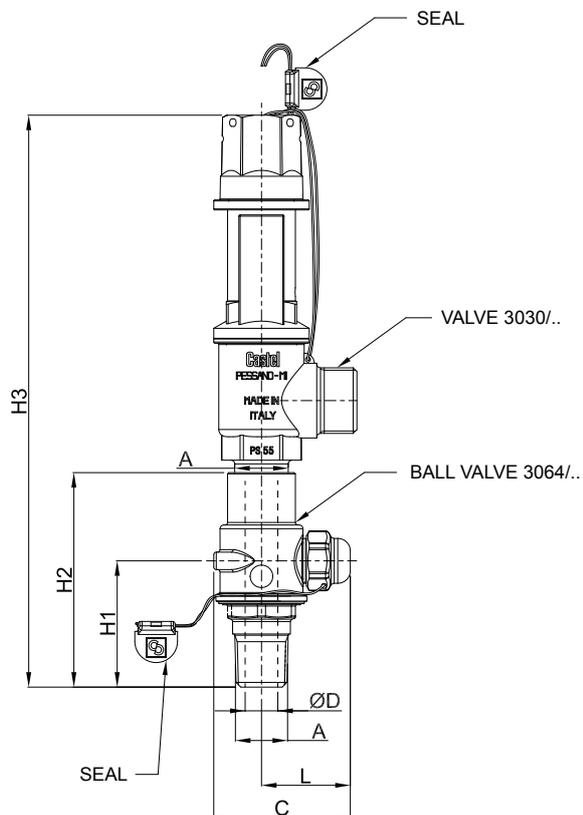

- a. Valves in series 3064 can be used with the following refrigerant fluids:
 - HCFC (R22)
 - HFC (R134a, R32, R404A, R407C, R410A or R507)
 - HFO and HFO/HFC mixtures (R1234yf, R1234ze, R448A, R449A, R450A or R452A)
- b. Valves in series 3064N can be used with the following refrigerant fluids:
 - HFC (R134a, R32, R404A, R407C, R410A or R507)
 - HFO and HFO/HFC mixtures (R1234yf, R1234ze, R448A, R449A, R450A or R452A)
 - HC (R290 , R600 , R600a)

CAUTION! Valves in series 3064N cannot be installed on systems that use HCFC (R22) refrigerants or other refrigerants blended with mineral oils or alkylbenzenes.
- c. Valves in series 3064E can be used only with refrigerant fluid R744.

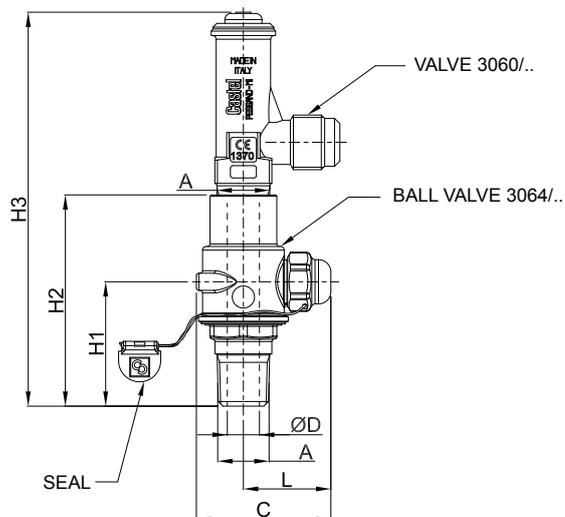

CONSTRUCTION

Valves in series 3064, 3064N and 3064E are supplied by Castel in the open position and the spindle cap protection is sealed with a Castel lead seal. Any operation to close the valve requires causes the tampering with the seal and must be performed exclusively by:

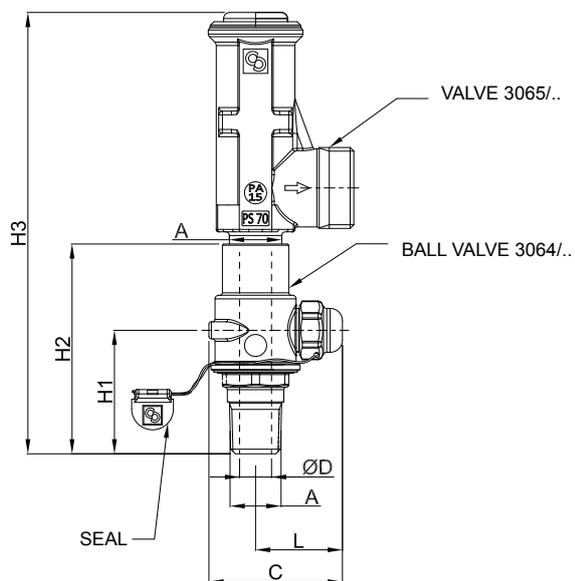

- staff authorized to work on the system
 - an operator of a competent inspection body
- These persons will be responsible for the subsequent re-opening of the valve and the application of a new cap seal with their own lead seal.
- The main parts of the valves in series 3064, 3064N, and 3064E are made from the following materials:
- Hot forged brass EN 12420 – CW 617N for the body
 - Hot forged brass EN 12420 – CW 617N, chromium plated, for the ball
 - Steel, with proper surface protection, for the spindle.
 - P.T.F.E. for the ball seat gaskets
 - Chloroprene rubber (CR) for outlet seal gaskets in valves series 3064
 - Hydrogenated nitrile butadiene rubber (HNBR) for outlet seal gaskets in valves series 3064N
 - Ethylene propylene diene monomer rubber (EPDM) for outlet seal gaskets in valves series 3064E
 - Hot forged brass EN 12420 – CW 617N for the protective cap of the spindle

CHAPTER 9 ■

BURSTING DISC DEVICES IN SERIES 3070

GENERAL DESCRIPTION

Safety device 3070 is a pressure relief device that cannot be closed again, in which a bursting disc is sensitive to a positive differential pressure between the upstream and downstream sections. It is designed to burst at a specified pressure.

Bursting discs in series 3070 are identified by means of:

- a model number formed of an alphanumeric code that includes:
 - the family identity (for ex. 3070/44C)
 - the type of connection (C = NPT)
 - the burst pressure, expressed in bar, multiplied by 10 (for ex. 140)
- a serial number for the lot production.

CONSTRUCTION

Bursting disc holder: this is the body of the device; it is manufactured in two halves, screwed together, that hold the burst disc in position. The two body halves are obtained through bar machining. The lower half of the body houses the inlet connection, while the upper half houses the outlet connection and two 1/8" NPT female service ports.

Material used: EN 12164-CW614N brass

Bursting discs: the discs are designed and tested, according to the requirements of EN ISO 4126-2:2003, to burst at a pre-defined pressure. This pressure is called specified burst pressure, and is related to an associated temperature and a burst tolerance. The disc is manufactured from a calibrated gauge of nickel sheet, contained by a copper ring case.

SCOPE

Use: protection against possible overpressure of the apparatuses listed below, with regard to the operating conditions for which they have been designed:

- Refrigeration system or heat pump components, for instance: condensers, liquid receivers, evaporators, liquid accumulators, positive displacement compressor discharge, heat exchangers, oil separators, or piping. (reference standard: EN 378-2:2016)

Fluids: the bursting disc devices in series 3070 can be used with:

- a. Refrigerant fluids in liquid or gaseous state belonging to Group 2:
 - HCFC (R22)
 - HFC (R134a , R404A , R407C , R410A , R507)
 - HFO and HFO/HFC mixtures (R1234ze , R448A , R449A , R450A , and R452A)
 - R744

with reference to Article 13, Para. 1(b) of Directive 2014/68/EU (EC Regulation No. 1272/2008).

- b. Air and nitrogen (reference Directive: 2009/105/EC)

The bursting disc devices in series 3070, which can only be used in combination with safety valves in series 3061 or 3065, can be used with:

- c. Refrigerant fluids in liquid or gaseous state belonging to Group 1:
 - HFC (R32)
 - HFO (R1234yf)
 - HC (R290 , R600 , R600a)

with reference to Article 13, Para. 1(a) of Directive 2014/68/EU (EC Regulation No. 1272/2008).

For specific applications with refrigerant fluids not listed above, please contact Castel Technical Department.

MARKING

In compliance with the provisions of Article 19 of Directive 2014/68/EC, the following information is reported on the bursting disc holder:

- Manufacturer's mark
- CE marking
- Identification number of the notified body involved in the production control phase
- device model
- Flow section
- Indication of flow direction
- Bursting pressure
- Performance tolerances
- Temperature associated with bursting pressure
- Production date
- Lot number

DOCUMENTATION

The bursting disc devices in series 3070 are supplied with the following documents, provided in the packaging:

- operating instructions for the user, containing all information useful for safety in terms of assembly, commissioning, use, and maintenance.
- Compliance Statement for the equipment according to Directive 2014/68/EU, required in Article 17 and issued in compliance with Annex IV of the same directive.

BURSTING DISC DEVICES SELECTION

Directive 2014/68/EU requires that pressure equipment, in which permissible limits are reasonably likely to be exceeded, shall be fitted with suitable protection devices, for instance safety devices such as bursting disc devices. Such devices shall prevent pressure from permanently exceeding the maximum allowable pressure (PS) of the equipment they protect. In any case, a short pressure peak limited to 10% of maximum allowable pressure is permitted.

The bursting disc safety device 3070 may be used either as sole pressure relief device or in conjunction with a Castel safety valve (types 3030, 3060, 3061, or 3065). The disc and valve combination prevents refrigerant leakage through the safety valve and the total loss of refrigerant after bursting. The disc and valve combination can be also equipped with a suitable pressure switch to detect if the valve has discharged.

The bursting pressure of a bursting disc is affected by the operating temperature of fluid contained in the equipment to be protected. The specified bursting pressure (P_b), stamped on the body of the bursting disc, is the nominal bursting pressure at the associated temperature of 22 °C. At higher operating temperatures, the nominal bursting pressure is reduced while at lower operating temperatures, the nominal bursting pressure is increased. Refer to table 6 for temperature adjustment factors for P_b .

As to the selection and sizing of the suitable protection device, users shall refer to the specific product and sector standards listed below:

- Standard EN ISO 4126-2: 2003: "Safety devices for protection against excessive pressure – Part 2: Bursting disc safety devices" specifies the design, manufacturing, inspection, testing, certification, marking and packaging requirements for bursting disc safety devices.
- EN ISO 4126-3:2006 Safety devices for protection against excessive pressure – Part 3: Safety valves and bursting disc safety devices in combination" specifies the general requirements for design, application and marking for a product assembled from the in-series combination of a safety valve and bursting disc safety device.
- EN ISO 4126-6: 2003: "Safety devices for protection against excessive pressure – Part 6: Application, selection and installation of bursting disc safety devices" gives guidance on the application, selection

and installation of bursting disc safety devices used to protect against overpressure.

- EN 378-2:2016: "Refrigerating systems and heat pumps – safety and environmental requirements – Part 2: Design, construction, testing, marking and documentation" provides a general outline of the protection devices to be used in refrigerating systems and their characteristics (Para. 6.2.5) and the criteria for the selection of the device suitable for the type and size of the system component to be protected (Para. 6.2.6).
- EN 13136:2013: "Refrigerating systems and heat pumps – Pressure relief devices and their associated piping – Methods for calculation" highlights the possible causes of overpressure in a system and provides users with the tools for sizing pressure relief devices, among which safety valves.

SIZING OF BURSTING DISC DEVICES DESIGNED TO DISCHARGE GAS OR VAPOUR AT CRITICAL FLOW (REF. EN ISO 4126-6:2003)

A bursting disc safety device which discharges to atmosphere works at critical flow. For the definition of critical flow, please see Chapter 5.

Bursting disc devices designed to discharge gas or vapour at critical flow must be sized according to the following formula:

$$A_c = 3,469 \times \frac{Q_{md}}{C \times \alpha} \times \sqrt{\frac{v_o}{p_o}} \quad [\text{mm}^2]$$

where:

- A_c = minimum cross-section area of the bursting disc [mm^2]
- Q_{md} = minimum required discharge flow rate of the bursting disc [kg/h]
- α = bursting disc coefficient of discharge
- p_o = bursting pressure [bar abs]
- v_o = specific volume of gas or vapour at discharge conditions p_o and T_o , where T_o is the fluid temperature at bursting disc inlet, defined by the user or by the designer [m^3/kg]
- C = expansion rate as a function of the k coefficient in the isentropic equation T_o calculate C and to find the values of k and C for the more common refrigerants, see Chapter 5.
- EN ISO 4126-6:2003 establishes different values for the coefficient of discharge, " α ", depending on the nozzle entry configuration where the bursting disc is mounted. The following cases are demonstrated in the aforesaid Standard, Par. C.2.2.1:
 - In case of an internally protruding branch/nozzle: $\alpha = 0.68$
 - In case of a flush branch/nozzle whose inlets are not of hydrodynamic configuration: $\alpha = 0.73$
 - In case of a flush branch/nozzle with rounded or chamfered inlets: $\alpha = 0.80$

The evaluation of the minimum required discharge capacity of the bursting disc device is closely linked to the type of system where the equipment it protects is installed, with the causes that may cause it to burst, i.e.:

- external heat sources
- internal heat sources
- increased pressure caused by a positive displacement compressor

For the calculation of minimum required discharge capacity in these three cases see Chapter 5 "Selection Criteria for Safety Valves" in this technical handbook.

SIZING OF COMBINED SAFETY DEVICES DESIGNED TO DISCHARGE GAS OR VAPOUR AT CRITICAL FLOW (REF. EN ISO 4126-3:2006)

A **combination** is an installation which includes a bursting disc safety device installed at most five pipe diameters before the inlet of a safety valve. The combination of a specific safety valve with a bursting disc device is characterized by a combination discharge capacity coefficient " F_d ". According to EN ISO 4126-3: 2006, this coefficient is the ratio of the average of the discharge coefficients (" K_d ") of the combination, measured in test bench flow rate tests, to the certified discharge coefficient (" K_d ") of the safety valve alone. The same standard also permits, as an alternative to the tests to determine " K_d " of the group, the use of a predefined discharge coefficient (" F_d "), equal to 0.9, a slightly lower value than that which could be obtained from testing. Therefore, to size the combination of a safety valve (3030, 3060, 3061 or 3065) with a bursting disc safety device (3070), please follow the procedure provided in Chapter 5, but multiply the certified coefficient of discharge (" K_d ") by 0.9.

INSTALLATION OF BURSTING DISC DEVICES AND COMBINATIONS

Bursting disc safety device 3070 must never be subjected to a negative pressure differential upstream and downstream of the disc (for example: discharge to the atmosphere and pressure inside the equipment to be protected lower than that of the atmospheric pressure) to avoid damaging or breaking the disk. For this reason, safety device 3070 must always be used along with a cut-off device (such as valve 3064/44) which can exclude device 3070 any time there is a vacuum in the equipment to be protected.

When the bursting disc discharges it is necessary to replace the entire unit, as safety devices 3070 are sealed components and the bursting disc cannot be replaced.

The maximum operating pressure of the equipment to be protected must not be greater than 75 % of the burst pressure of device 3070 to avoid damages to the disc or leakage. If the operating pressure exceeds 85 % of the burst pressure, safety device 3070 must be replaced immediately.

As far as the installation of bursting disc safety devices and combined devices is concerned, remember these basic points:

- Safety devices must be installed in an area of the system where vapours or gases are present and there is no fluid turbulence.
- Vessels joined by piping, of a diameter deemed by the manufacturer and the user to be adequate, without any stop valves between them, may be considered as a single vessel for the installation of a safety device.
- The fitting between the combined device and the equipment to be protected must be as short as possible. Furthermore, the cross-section of the piping must not be smaller than the valve inlet. In any case, EN 13136:2013 states that the pressure drop between the protected vessel and the combined device, at discharge capacity, shall not exceed 3% of the pressure setting value, including any accessories in the line.
- The location selected for installation of the safety device must consider that its operation involves the discharge of the refrigerant fluid under pressure, sometimes at high temperature. Where there is the risk of causing injuries to people nearby, exhaust piping must be provided, sized so as to not compromise the operation of the device. When installing combined devices, EN 13136:2013 requires that this piping must not generate, at discharge capacity, a back-pressure exceeding 10% of the valve setting pressure. In the event of multiple valves installed in parallel, it is highly recommended that each valve be fit with a dedicated exhaust line rather than a single manifold for all of the valves. The risk of the latter solution is to create an overpressure in the manifold determined when a valve discharges. This overpressure can modify the operating characteristics of all the other valves installed in parallel.

To calculate the pressure loss in either the upstream line (between vessel and safety device) or the downstream line (between safety device and atmosphere) refer to Chapter 5 "Selection Criteria for Safety Valves" in this technical handbook.

CHAPTER 10 ■

FUSIBLE PLUGS IN SERIES 3080 AND 3082

GENERAL DESCRIPTION

According to the definition given in Para. 3.6.4 of EN 378-1:2016, a fusible plug is a device containing material that melts at a predetermined temperature, thereby relieving the pressure.

Castel has decided to classify the fusible plugs in series 3080/.C and 3082/.C in the Risk Category I. This determines their use, as protection devices, on specific pressure equipment, in the same Risk Category I, in compliance with Annex II, Point 2, of Directive 2014/68/EU. Consequently, fusible plugs in series 3080/.C and 3082/.C **cannot be used**, as sole protection devices, on pressure equipment in Risk Categories greater than I.

CONSTRUCTION

The body of the fusible plug is an NPT threaded plug drilled with a through hole, with the taper opposite that of the thread. This hole is filled with a specific amount of fusible alloy, with known melting point.

Materials used:

- EN 12164 – CW 614N lead-free hot tinned brass for the plug
- Cadmium-free eutectic alloy with several components for the fusible material

SCOPE

Use: fusible plugs are basically used to protect the components in a refrigerating system or heat pump against possible overpressure, based on the operating

conditions for which they have been designed, caused by an excessive external heat source, such as fire. (Para. 6.2.6.6 of EN 378-2:2016)

Fluids: fusible plugs in series 3080 and 3082 can be used with Group 2 refrigerant fluids in either the gaseous or vapour state:

- HCFC (R22)
- HFC (R134a , R404A , R407C , R410A , R507)
- HFO and HFO/HFC mixtures (R1234ze , R448A , R449A , R450A , and R452A)

with reference to Article 13, Para. 1(b) of Directive 2014/68/EU (EC Regulation No. 1272/2008).

MARKING

In compliance with the provisions of Article 19 of Directive 2014/68/EU and of Para. 7.3.3 of EN 378-2:2016, the following data are reported on the hex nut of fusible plug:

- CE marking
- Castel logo
- Maximum allowable pressure, PS
- Melting point

INSTALLATION

If a fusible plug is mounted on a pressure vessel, it must be installed in a position in which the refrigerant in the superheated gaseous state does not compromise proper operation. Fusible plugs must never be covered by thermal insulation.

Discharge from fusible plugs shall take place so that persons and property are not endangered by the released refrigerant. (Para. 6.2.6.6 of EN 378-2:2016).

EN 378-2:2016 establishes that a fusible plug cannot be used as pressure relief device on vessels containing refrigerants in Groups A2, B1, B2, A3 or B3. The same standard establishes that a fusible plug cannot be used as the sole pressure relief device between a refrigerant containing vessel and the atmosphere in systems with a refrigerant charge greater than 2.5 kg of Group A1 refrigerants (for ex. R22, R134a, R404A, R407C, R410A, R507).

FUSIBLE PLUG SELECTION

Directive 2014/68/EU requires that pressure equipment, in which it is reasonably possible to forecast that the admissible limits will be exceeded, shall be fit with suitable protection devices, for instance safety devices such as fusible plugs. Such devices shall prevent pressure from permanently exceeding the maximum allowable pressure (PS) of the equipment they protect. In any case, a short pressure peak limited to 10% of maximum allowable pressure is permitted.

As to the selection and sizing of the suitable protection device, users shall refer to the specific product and sector standards.

- EN 378-2:2016: "Refrigerating systems and heat pumps – safety and environmental requirements – Part 2: Design, construction, testing, marking and documentation" provides a general outline of the protection devices to be used in refrigerating systems and their characteristics (Para. 6.2.5) and the criteria for the selection of the device suitable for the type and size of the system component to be protected (Para. 6.2.6).
- EN 13136:2013: "Refrigerating systems and heat pumps – Pressure relief devices and their associated piping – Methods for calculation" highlights the possible causes of overpressure in a system and provides users with the tools for sizing pressure relief devices, among which fusible plugs.

SIZING OF FUSIBLE PLUGS (REF. EN 13136:2013)

As fusible plugs discharge to the atmosphere, they always work in critical flow (for the definition of critical flow, see Chapter 5).

Fusible plugs must be sized as follows:

$$A_c = 3,469 \times \frac{Q_{md}}{C \times K_{dr}} \times \sqrt{\frac{v_o}{p_o}} \quad [\text{mm}^2]$$

where:

- A_c = minimum net cross-section area of the fusible plug orifice [mm^2]
- Q_{md} = minimum required discharge flow rate of fusible plug [kg/h]
- K_{dr} = derated coefficient of discharge of fusible plug, equal to $0.9 \times K_d$
- p_o = pressure upstream of the fusible plug, inside the equipment to be protected [bar abs]
- v_o = specific volume of gas or vapour at discharge conditions, p_o and T_o , where T_o is the fluid temperature at plug inlet during discharge, defined by the user or by the designer [m^3/kg]

- C = expansion coefficient as a function of the k coefficient (as measured at 25°C , see Para. 7.2.3 of EN 13136:2013) in the isentropic equation calculated with the following formula:

$$C = 3,948 \times \sqrt{k \times \frac{2}{k+1} \left(\frac{k+1}{k-1} \right)}$$

To find the values of k and C for the more common refrigerants, see Chapter 5

The evaluation of the minimum required discharge capacity of a fusible plug is closely linked to the main cause that can cause its opening, which is an external heat source. The minimum required discharge capacity is determined by the following formula:

$$Q_{md} = \frac{3600 \times \varphi \times A_{surf}}{h_{vap}} \quad [\text{kg/h}]$$

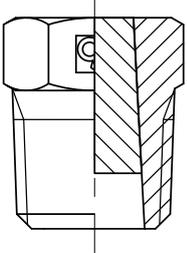

where:

- φ = density of heat flow rate, assumed to be $10 \text{ [kW/m}^2]$
- A_{surf} = external surface area of the vessel [m^2]
- h_{vap} = latent heat of vaporization of liquid at p_o [kJ/kg]

EN 13136:2013 also establishes the following maximum limits for the value of K_{dr} , based on the type of connection between the fusible plug and the equipment to be protected:

- flush or flared fitting to the housing of the vessel: $K_{dr} = 0.70$
- internally protruding fitting to the housing of the vessel: $K_{dr} = 0.55$

TABLE 27: General characteristics, dimensions and weights of fusible plugs 3080 and 3082
